[†] See Table 6 and Figures 8 and 9 for correction factors C_d , C_p and time T_1 . For exposure durations greater than 10 seconds and extended sources in the retinal hazard region (0.400 to 1.4 μm), see Table 5b.

Notes:

1. For repeated (pulsed) exposures, see Section 8.2.3.
2. The wavelength region λ_1 to λ_2 means $\lambda_1 \leq \lambda < \lambda_2$, e.g., 0.180 to 0.302 μm means $0.180 \leq \lambda < 0.302 \mu\text{m}$.
3. Dual Limit Application: In the Dual Limit Wavelength Region (0.400 to 0.600 μm), the listed MPE is the lower value of the photochemical and thermal MPEs as determined by T_1 .

[†]See Table 6 and Figures 8, 9 and 11 for correction factors C_A , C_B , C_C , C_D , C_E , and time T_2 .

*For sources subtending an angle greater than 11 mrad, the limit may also be expressed as an integrated radiance $L_p = 100 C_B \text{ J} \cdot \text{cm}^{-2} \cdot \text{sr}^{-1}$ for $0.7 \text{ s} \leq t < 10^4 \text{ s}$ and $L_p = C_B \times 10^{-2} \text{ W} \cdot \text{cm}^{-2} \cdot \text{sr}^{-1}$ for $t \geq 10^4 \text{ s}$ as measured through a limiting cone angle γ . These correspond to values of $\text{J} \cdot \text{cm}^{-2}$ for $10 \text{ s} \leq t < 100 \text{ s}$ and $\text{W} \cdot \text{cm}^{-2}$ for $t \geq 100 \text{ s}$ as measured through a limiting cone angle γ .

$\gamma = 11$ mrad for $0.7 \text{ s} \leq t < 100 \text{ s}$,

$\gamma = 1.1 \times t^{0.3}$ mrad for $100 \text{ s} \leq t < 10^4 \text{ s}$

$\gamma = 110$ mrad for $10^4 \text{ s} \leq t < 3 \times 10^4 \text{ s}$

See Figure 3 for γ and Appendix B7.2 for examples.

Notes:

- For repeated (pulsed) exposures, see Section 8.2.3.
- The wavelength region λ_1 to λ_2 means $\lambda_1 \leq \lambda < \lambda_2$, e.g., 1.180 to 1.302 μm means $1.180 \leq \lambda < 1.302 \mu\text{m}$.
- Dual Limit Application: In the Dual Limit wavelength region (0.400 to 0.600 μm), the exposure limit is the lower value of the determined photochemical and thermal exposure limit.
